

Floren

(Foliar Hormone spray)

(Potential growth hormone for floriculture in Particular)

Target Crops : Flowers of all types, Orchids, Leguminous vegetables in particular etc.

Classification and mode of action : TRASCO FLOREN

is a foliar based application for flower plants, this is a hormonal preparation meant for flower and orchid cultivation.

Product Potential : This product is meant for amateur flower hobbyists and farmers who are involved in commercial flower cultivation. To get uniform flowering pattern in their crops farmers can use this product to their advantage. The flowers will bloom to their original size, the flower drop will not occur. The natural color of the flower will show up. The number of flowers will increase, and the application of this product will also ensure the extended keeping quality of the cut flowers. Farmers can transport the flower to long distances without much damage to the cut flowers. This products aids in bud formation and timely blooming properties of the flower.

Dosage :

As foliar application :

Mix one drop of the product in the liter water, and use the same as foliar spray.

Use regularly during the growth phase of the plant, first spray to be given 7-10 days before the expected bud formation, (Pre blossoming spray) thereafter spray every 25 days. 2-3 sprays will be very useful.

Vegetables: during the first flowering stage @ 1drop/lit of water
